
Parallel port interface using visual c++...

Posted by vijunambiar - 2009/02/06 07:26

Dear all,

I'm in a project in which I'll need to interface with an external H/W device.

I need to get interrupt from this external H/W through the parallel port(i.e. IRQ7),

I have found many code samples on the web but they only work on Borland compiler!!! How to make this on Visual Studio enviroment.

I also need to make a specific job periodically and that requires to make a Timer interrupt, how could I make this also?

I needed to use the parallel port for interfacing this external H/W so I'm using

_outp(add,data) but this doesn't work on WinXP because of the protection set on these ports, how to avoid this?

I am a newbie...so please give sample codes and your views..

Thanks in advance

V Mohan
